**Amendments to the Specification:**

Please replace paragraph [0025] with the following amended paragraph:

Please refer to Fig.13 and Fig.14. Fig.13 and Fig.14 are schematic diagrams illustrating another embodiment of the present invention. As shown in Fig.13 and Fig.14, the sleeve 31 and the stopping member 14 can be connected by means of a flexible transmission member 40. The flexible transmission member 40 is a circular member, such as a belt, a rack, or a chain, connected to both the sleeve 31 and the stopping member 14. Therefore, the sleeve 31 and the stopping member 14 are moved by frictional force. In addition, if the sleeve 31, the stopping member 14, and the flexible transmission member 40 include respective gears 317, 141, and gear teeth 41, then the sleeve 31 and the stopping member 14 can be moved by means of mesh transmission. Further, the flexible transmission member 40 can be modulated by a tension modulator 42 for adjusting the tightness.
